

AI Resume ATS Checker Using Python and Flask

Objective

The objective of this project is to develop a web-based application that analysis resumes and calculates an ATS (Applicant Tracking System) score. The system extracts text from uploaded resumes, identifies technical skills, displays detected and missing skills, and provides recommendations to improve the resume.

Technologies Used

- Python
- Flask
- HTML
- CSS
- VS Code
- PDF Text Extraction
- Skill Matching Algorithm

Project Description

The AI Resume ATS Checker allows users to upload their resume in PDF format. The application extracts text from the resume and compares it with a predefined list of technical skills such as Python, Java, SQL, Machine Learning, Flask, GitHub, and others.

Based on the matched skills, the system calculates an ATS score and displays:

- ATS Score
- Detected Skills
- Missing Skills
- Resume Recommendation

The application provides feedback such as:

- Excellent Resume
- Good Resume
- Need Improvement

Working Process

1. User uploads a resume.
2. Flask receives the uploaded file.
3. Text is extracted from the PDF.
4. Skills are identified using keyword matching.
5. ATS score is calculated.
6. Missing skills are displayed.
7. Recommendation is generated.
8. Results are shown on the web page.

Features

- Resume Upload
- ATS Score Calculation
- Skill Detection
- Missing Skill Analysis
- Resume Recommendation
- User-Friendly Interface

Output

The system successfully analysis resumes and generates ATS scores along with recommendations. It helps users understand missing skills and improve their resumes for better job opportunities.

Conclusion

The AI Resume ATS Checker is a simple and effective tool for resume analysis. It assists job seekers in optimizing their resumes and improving their chances of passing ATS screening systems used by recruiters.
